

Shunyata Research

Shunyata Research is the result of research into electrical and cabling systems conducted by Caelin Gabriel in the late 1990s. Powered (pun intended) initially by his obsession to improve the performance of high-quality audio, Shunyata's products have also found a home in the demanding environments of film production and medical and surgical technology.

Before Shunyata, Gabriel was a US military research scientist in the field of ultra-sensitive data acquisition...

and a career spent trying to detect signals otherwise obscured by noise makes Gabriel ideally suited to develop products designed to reduce signal and power-line based noise in audio.

Holding 10 patents in power noise reduction, component to component interference reduction, and reduction of dielectric absorption, Shunyata Research's unorthodox approaches clearly work.
