

Pass Labs

While the Class A amplifier circuit harks back to the early days of transistor amplifier circuit design, the modern single-ended Class A amplifier is a product of legendary audio electronics engineer, Nelson Pass. With Mike Burley, Nelson Pass founded the company that still bears his name back in 1991. Pass, along with preamplifier maestro Wayne Colburn, remain at the leading edge of amplifier development, working with Pass Labs to continue to produce ever better amplifiers.

Where many audio electronics companies begin to diversify, producing digital audio devices and the rest, Pass Labs has remained true to its original intention; producing damn good integrated amps, power amps, preamps, and phono stages.

Since its first days, Pass built amplifiers that appear simple in circuit design. However, they can also be extremely versatile and powerful too.
